Can't wait to eat a pawpaw?

We now have Frozen Pawpaw Purée available year-around!
All the skin, seeds and fibers have been removed to ensure uniform quality. Made from the fresh fruit in our orchards!
1 pint (16oz) = \$10 + S&H
1 quart (32oz) = \$18 + S&H

Orders will be filled as they are received.

Due to the increase in demand for Pawpaws, we apologize for the limited numbers of grafted Pawpaws available. We are currently in the process of growing and grafting trees for Fall 2018-2019 seasons and beyond.

Grafted Pawpaws vs Seedling Pawpaws

Grafted Pawpaws

For short-term results it is advisable to plant clonally grafted fruit trees. For fruit growing 'beginners', grafted plants are certainly a good investment. With grafted trees you are sure of getting a known quality fruit and regular crops within the minimum amount of time. As a general rule, grafted trees bear in half the time of a seedling, however this is variable. When choosing a grafted specimen you have the benefit of the performance, quality and uniformity of the scion (top growth) from an excellent parent plant.

Our Pawpaws are grafted on root stock grown from our orchards here at Nash Nurseries in Mid-Michigan (zone 5b). It is advisable to plant 2+ different grafted named cultivars to ensure proper pollination. (i.e. 1-'Potomac[®]' Hybrid Peterson Pawpaw & 1-'Shenandoah[®]' Hybrid Peterson Pawpaw)

Seedlings

Seedling trees tend to be more vigorous, longer living, have better wind resistance and are often more disease resistant due to their genetic diversity. Seedling trees are also adaptable. It is this adaptability and hardiness that makes seedlings a preferred choice when planting out in less than ideal conditions.

No two seedlings are the same and it is this diversity, a natural occurrence, where lies the opportunity to improve selection, whether it is for quality of flowers or foliage, disease resistance, growth characteristics or quality of fruit. It is a complete unknown of what type of fruit and production a seedling will exhibit. Seedlings do make excellent pollinators when planted amongst grafted cultivars. (i.e. 1+ 'Shenandoah[®]' Hybrid Peterson Pawpaw & 1+ Seedling Pawpaw).

Seedlings can also always be grafted at a later date with a scion wood from a known cultivar. Essentially you can grow a seedling, see if you do indeed like the fruit or not, then "top work" (graft) the tree into a known cultivar. . Seedlings work great for pollination and moderate fruit production. If you are just getting started in growing Pawpaws, seedlings provide an inexpensive option.

If you have any questions, please contact us! We will be happy to help you figure out what type of tree will work the best for your situation!

Pawpaw Cultivars and Descriptions

<u>Name</u>	<u>Description</u>	<u>Fruit Size</u>	<u>Ripening Time (In Michigan)</u>
Seedling	Seedling trees are grown from seed harvested from the orchards at Nash Nurseries. All seed used is harvested from named grafted cultivars. There is no guarantee of what the fruit size, flavor, or ripening time will be. Seedlings are a good choice for an inexpensive pollinator.	?	Fall
Atwood™	Released by Kentucky State University Horticulture Program. Fruit has yellow-orange flesh. Very good flavor.	Medium	1st week of October
Davis	Selected from a wild grove in Michigan by Corwin Davis. Mottled green skin and yellow flesh. Keeps well in cold storage. A favorite here at the nursery.	Large-Very Large	1st week of October
Lynn's Favorite	Another cultivar selected from Corwin Davis's orchard. Remarkable golden flesh, and very smooth.	Large	2nd week of October
NC-1	This hybrid seedling of Davis x Overleese is one of Nash Nurseries favorites. Selected in Ontario, Canada in 1976. Fruit has few seeds and ripens earlier than most.	Large	Mid-September
Overleese	Selected from wild in Rushville, IN in 1950. Sets large, tender, and juicy fruit with great flavor.	Large	1st week of October
Pennsylvania Golden	Fruit has yellow skin when ripening and golden flesh. One of earliest ripening pawpaws that we carry. Very hardy, very flavorful and sweet.	Medium	Mid-September
Peterson Hybrid Allegheny®	Size of fruit can be increased by thinning when fruit set is high. Firm and smooth flesh, yellow in color.	Medium	Late September
Peterson Hybrid Potomac®	Selected by Neal Peterson. Fruit is extremely fleshy and typically the least seeds of all cultivars.	Medium-Large	1st week of October
Peterson Hybrid Rappahannock®	Selected by Neal Peterson. Fruit tends to show a yellowish color break at picking stage. This tree is particularly noteworthy due to its unusual leaf habit. Leaves tend to be held horizontal-to-upright making fruit more visible.	Medium	Last week of September
Peterson Hybrid Susquehanna®	Selected by Neal Peterson. Fruit tends to have few seeds and be very fleshy. Thick skin makes this variety less fragile than others, making it perfect to ship to a friend. Excellent flavor.	Large	2nd week of October
Peterson Hybrid Wabash®	Selected by Neal Peterson. Fruit flesh is moderately firm, creamy, and smooth. Flesh color is yellow to orange. Very good flavor.	Very Large	2nd week of October
Peterson Hybrid® Shenandoah®	Selected by Neal Peterson as a seedling of Overleese. Fruit has creamy yellow flesh with few seeds. Excellent flavor.	Large	1st week of October
Prolific	Selected by Corwin Davis in Bellevue, MI. Fast grower and fruit has light golden flesh.	Medium	1st week of October
